SYSTEMS

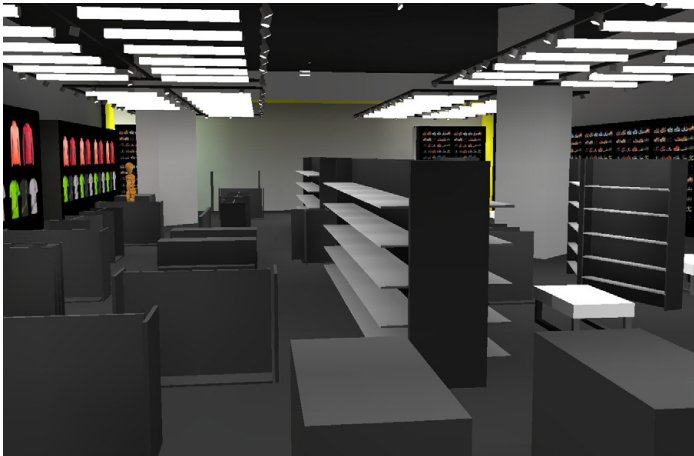

Retail Lighting Solutions

Aglo Systems specialises in lighting for the retail industry. Established in 2004, we have earned a solid reputation for the provision of high-quality products, technical expertise and personalised service. With end-to-end project management, from light planning to installation and post-completion project follow-up, our aim is to simplify the lighting procurement process and to 'continually improve your lighting experience'.

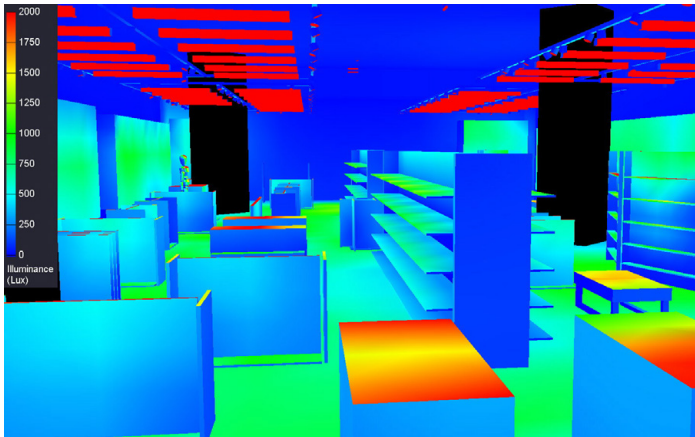

Lighting Design Service

Our lighting designers can develop lighting concepts and solutions to enhance your customers' shopping experience, highlight your retail offering and ultimately drive sales. We can provide out-of-the-box concepts to achieve desired outcomes: from achieving even and balanced illumination across the store, to using lighting to emphasise and highlight product displays and off-locations, or to simply provide a more dynamic customer experience.

In the following design example, we can achieve focus and contrast between the display and background areas by highlighting standout products.

3D Render – JD Sports Main Retail Area

Pseudo Colour Render – JD Sports Main Retail Area

Energy Efficient Lighting Upgrades

By upgrading your lighting with energy-efficient LED fittings, you can significantly reduce maintenance costs and achieve up to 70% annual energy savings, with payback periods as short as 18 months. A lighting upgrade will also improve the quality of the lighting in store, both highlighting your offering and enhancing the customer experience.

Our upgrade solutions provide you with the latest technologies and highest efficiencies, whilst ensuring both products and installation meet Australian Standards. Stores in NSW and Victoria may be eligible for Government rebates for lighting upgrades. Aglo can manage end-to-end project design and delivery, including the rebate process, and ensure that you receive the maximum discount possible. Ask us for a site assessment.

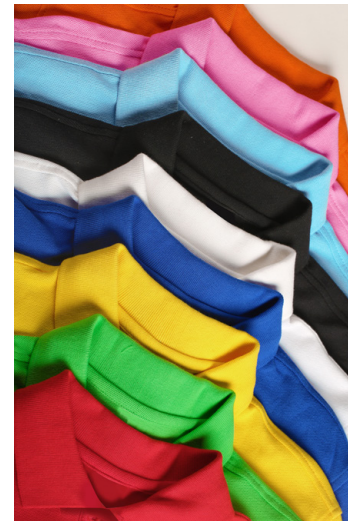

Make your products pop off the shelf

Our 'Brilliant Vivid' LED technology provides enriched high-colour rendering, making the saturation and hue of an object more accurate when compared to daylight. The ability to represent a greater range of colours and contrasts makes the texture and detail of a product clearer.

Standard LED
3000K CRI 80

No highlighting of colours. Reds, blues and greens are not very accurately presented. Whites appear yellowish.

Brilliant Vivid LED
3000K CRI 97

Brilliant Vivid LED is able to create beautiful saturated colors which represent a full range of fine colour gradation in comparison with a standard LED.

Specsavers, Craigieburn

“ The Specsavers partners are very happy with their bright new store, especially the features of the new lighting. They clearly noticed the difference between the lighting in the retail space compared to the dispense area, which highlights the quality of the Aglo lighting. ”
